Ahmed Iprahim Abdelhamed

Data Analyst — SQL, Power BI & Analytics Engineering

Cairo, Egypt • +20 102 009 4823 • ahmediprahim750@gmail.com • LinkedIn • Portfolio & Dashboards • GitHub

SUMMARY

Data Analyst at Tabby (fintech) automating my own team's reporting by hand. I build SQL pipelines, Power BI semantic models (DAX, star schema), and Python ETL workflows that turn messy operational data into decisions: ~80% cut in weekly reporting time, dashboards used daily by a 32-person operations team, and delinquency analysis that feeds the credit-risk process. I care about numbers that hold up under scrutiny — and about explaining them in plain language to non-technical stakeholders.

CORE SKILLS

BI & Visualization: Power BI (DAX, Power Query, semantic modeling, drill-through), Looker Studio, Advanced Excel (pivot tables, what-if analysis), Plotly & Matplotlib

SQL & Databases: PostgreSQL, DuckDB, T-SQL — window functions, CTEs, complex joins, query tuning

Python & Data Engineering: Pandas, NumPy; automated ETL pipelines, Medallion architecture (Bronze→Gold), Kimball star schema, data cleaning & validation

Analytics & Statistics: EDA, statistical testing, KPI design (CSAT, SLA, churn, conversion), cohort & trend analysis, time-series forecasting, NLP sentiment analysis

Practices & Tools: Git, Bash, Google Sheets API, stakeholder reporting & data storytelling

PROFESSIONAL EXPERIENCE

Tabby

Cairo, Egypt | 2023 – Present

Data & Analytics Specialist (Customer Operations)

01/2024 – Present

- Replaced manual weekly reporting with Python + SQL + Power BI pipelines that extract, clean, and validate multi-source operational logs (50,000+ records), cutting reporting turnaround ~80% (10+ hours/week).
- Built interactive Looker Studio and Power BI dashboards tracking CSAT, SLA compliance, and response latency for a 32-person operations team; presented insights to non-technical stakeholders in weekly reviews.
- Queried relational databases to identify recurring merchant and consumer delinquency patterns; escalated high-risk anomalies to Credit Risk and supported payment-fraud and account-takeover (ATO) investigations.
- Forecast demand spikes via time-series and trend analysis on 10,000+ weekly customer inquiries to plan operational capacity.

Social Media & Customer Support Specialist 01/2023 – 09/2023

(promoted internally after automating the team's reporting)

- Maintained 92%+ CSAT across chat, email, and phone; tracked real-time engagement and resolution metrics to flag service-level variance during volume spikes.
- Built the team's first automated reports in Python and the Google Sheets API — the side project that moved me into the data team.

KEY ANALYTICS PROJECTS (code + live dashboards: portfolio & GitHub above)

Credit Risk & Expected Loss Stress-Testing Engine

Tech Stack: PostgreSQL, Power BI, DAX (public consumer-lending dataset, 32,000+ records)

- Cleaned loan applicant records in PostgreSQL (median imputation, outlier capping on income and employment variables).
- Modeled Expected Loss (EL = EAD × PD × LGD) with custom DAX measures and dynamic 'What-If' LGD parameters for stress scenarios.
- Built demographic risk heatmaps (Age Bands × Loan Grades); identified a 29% default concentration in Debt Consolidation to guide underwriting policy.

Retail Supply Chain & Inventory Analytics

Tech Stack: Python, DuckDB, Power BI, DAX (public retail dataset)

- Built a Medallion Architecture (Bronze→Gold) in DuckDB, standardizing multi-source retail data into a unified weekly exposure fact table.
- Modeled a Kimball star schema in Power BI with DAX measures (SUMX, CALCULATE) tracking stock turnover and inventory velocity.
- Flagged a 47% low-stock risk in Electronics, enabling reordering priorities across 56,000+ units.

Marketing Analytics & Customer Sentiment

Tech Stack: Power BI, Python, SQL, NLP (public campaign dataset)

- Cleaned campaign metrics (9M+ views, 1.7M+ clicks) and classified 1,300+ unstructured reviews via NLP sentiment analysis to track sentiment vs. campaign ROI over time.
- Identified 'Hockey Sticks' as the highest-converting product line (15.46%), enabling ad-spend reallocation to high-performing lines.

Customer Churn Analysis Dashboard

Tech Stack: Power BI, DAX, Power Query (Databel case study — simulated telecom data)

- Isolated churn drivers across 6,687 customers with drill-through pages: month-to-month contracts churn at 46.2% (7× two-year contracts); 44.8% of churn driven by competitor offers.
- Quantified revenue at risk and delivered a stakeholder-ready report with retention recommendations.

EDUCATION & CERTIFICATIONS

Bachelor of Science in Computer Science Helwan University | Graduated 2024

Certifications: Advanced AI & Deep Learning Specialization (In Progress, 2026) | ALX Data Analytics Professional | Data Science | Machine Learning | Python (2024).
